ABSTRACT:
LKPD (Institute of Regional Development Studies) is an institution that has a cooperative where the head office needs to have the goods distribution management system used for evaluating and monitoring the performance of their management - their cooperation with the goods distribution system. With the system of goods distribution, process distribution and the contribution from the central LKPD become more focused and effective, can also be a solution to overcome the limitations of the problem of providing a place to hold inventory. Goods Distribution System consists of several processes that include the data entry process of goods, determines access rights to users by the admin, process of data searching and reporting. It is expected that the proposed solution may reduce some obstacles faced, and a solution to problems related to management. In addition Goods Distribution System can be done with client-server process. The software in this Final Project is developed by using programming language PHP 5, MySQL, JavaScript and CSS.
