Key Words: PREFABRICATION, INDUSTRY, CONSTRUCTION

ABSTRACT:
Prefabrication is a manufacturing process carried out by using special tools in which various kinds of materials together to form part of a building. In the process of prefabrication faces several obstacles of various aspects of technology, materials, human resources, planning, logistics, production, transportation and distribution, installation and repairs. In its development has been widely used prefabricated and applied in the construction industry. Efficiency demands execution time and cost make this technology becomes rapidly despite facing some technical problems.
