Key Words: public transport, information center, Depok

ABSTRACT:
Along with the development of transportation, destination and route channels through which public transportation in the city led to the need faced by the public or prospective passengers to obtain public transport information accurately and easily, as happened in one terminal at the Kota Depok Terminal Depok. Problems may occur due to lack of facilities which provided by the local Department of Transportation. Therefore, needed a solution to the development of computer-based information systems form the application program that aims to facilitate the search for transportation, destination, and route the path through which the public transport bus station in the city of Depok. The developing an application begins with the discovery of the problem, then find the local public transportation data in the city of Depok Bus Station and Depok Transport Department. It followed by ERD design, database design, and applications design. Results of the application provides information about the data transport, destination, and route public transit lines in cities located in the city of Depok.
