ABSTRACT :
Logos Book Store is engaged in selling various kinds of equipment of worship, books, accessories, tapes, CD, VCD Songs and sermons. Sales system running right now is the input data item is still done manually. Giving rise to many problems, such as in the inventory data (inventory) and sold goods data and cause data redundancy. Based on the problems above, this research aims to create a system of computerized sales in order to facilitate the recording of transactions, which is more convenient, saves time, and can provide the right reports and accurate. The method used in the manufacture of this system is through the collection of data, systems analysis, system design, system implementation, and evaluation systems. Based on the testing and implementation of the system, it can be said that the results of these tests had been conducted in accordance with the design. Then, based on 5 respondents Questioner of the Logos Book Store in the evaluation system, the acquired 88% of respondents stated that this new system has worked well and as expected (according to the draft), whereas 12% stated that the new system has not run with well.
